Cisco Hybrid Cloud Platform for Google Cloud

Drive application innovation on your own terms

You want to take advantage of all the new innovations in application development and delivery, from public cloud to containers and microservices, to make the most of your applications.

But until now that's meant having to choose between development on premises or in the public cloud – having to compromise with monolithic "stacks" or being challenged to "glue" different parts together. It also meant more complexity, with more silo'd environments, technologies, teams, and vendors that won't always work well together. The result has been cost, risk, and lack of freedom.

It doesn't have to be this way. With the Cisco Hybrid Cloud Platform for Google Cloud, you can treat Google's public cloud as an extension of your IT environment with one optimized solution, supported across all components by Cisco.

Customizable to your needs, Cisco Hybrid Cloud Platform for Google Cloud offers:

· **Optimized management, networking, and security for the Google Cloud**

· **Integrated API management and discovery services to connect on-premises with public cloud applications**

· **On-premises hardware, and all the necessary open-source software and tools for a turnkey, 100 percent upstream, Kubernetes environment**

· **New Quick Start Services and a lifecycle of custom services to help you accelerate hybrid cloud adoption, enhance application agility and operational excellence, and reduce risk**

Benefits

· **Drive application innovation and agility** with access to the best tools to build and deploy applications anywhere

· **Increase cost-efficiency** by modernizing and extending your existing application investments on premises and in Google Cloud

· **Reduce risk and complexity** with a complete, optimized solution supported by Cisco

Cisco Hybrid Cloud Platform for Google Cloud

Freedom to develop and deploy anywhere

The Cisco Hybrid Cloud Platform for Google Cloud combines Cisco, Google, and open-source technologies to extend, consistently and securely, your on-premises environment to the Google public cloud.

Now you can:

- **Develop modern applications in Google Cloud, consuming data from your existing on-premises applications without having to re-platform**
- **Modernize your existing on-premises applications with direct and easy access to Google Cloud services**
- **Develop with a hybrid Continuous Integration/Continuous Delivery workflow across both on-premises and Google Cloud, with all the necessary tools in one common platform**

And, most importantly, you get integrated proactive security and threat detection across one unified encrypted network so that you can focus on what you want to build.

The end result? You can securely extend your existing investments without having to create new technology silos and drive application innovation by leveraging cloud-native capabilities in Google Cloud with complete freedom and without compromise.
